Pod Scenarios using Krknctl

```
krknctl run pod-scenarios (optional: --<parameter>:<value> )
```

Copy

Can also set any global variable listed here

Scenario specific parameters:

Parameter	Description	Type	Default
--namespace	Targeted namespace in the cluster (supports regex)	string	openshift-*
--pod-label	Label of the pod(s) to target ex. "app=test"	string	
--name-pattern	Regex pattern to match the pods in NAMESPACE when POD_LABEL is not specified	string	.*
--disruption-count	Number of pods to disrupt	number	1
--kill-timeout	Timeout to wait for the target pod(s) to be removed in seconds	number	180
--expected-recovery-time	Fails if the pod disrupted do not recover within the timeout set	number	120

To see all available scenario options

```
krknctl run pod-scenarios --help
```
